KAD OS: speaker script

For Castrol sales & marketing teams and their team leads · 45 minutes = 35 min talk + 10 min questions · Demo data only

How to use this script. Every slide has a time cue, one key message and the words to say (about 125 words a minute, with pauses). The same text is in the speaker notes of KAD_OS_Castrol_Teams.pptx. Words in brackets are actions, not speech. Slides 1 to 30 are the talk; B1 to B12 are backup slides for questions.

Timing plan

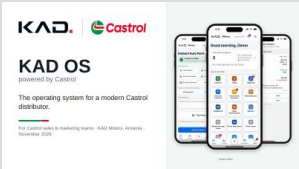

#	Slide	Time	Words
1	Title	0:00 - 0:45	112
2	Agenda	0:45 - 1:45	109
3	The brand's blind spot	1:45 - 4:15	276
4	What is KAD OS	4:15 - 5:30	168
5	A day from A to Z	5:30 - 7:00	123

27	Built and adopted	32:30 - 33:15	72
28	Next: the customer app	33:15 - 34:30	168
29	Three things to remember	34:30 - 35:00	58

30	Thank you, questions	35:00 - 45:00	71

On the day

- Open KAD_OS_Castrol_Teams.pptx (with videos) on the presenting laptop and play each of the 2 videos in the main part once (slides 8 and 17).
- Use Presenter View, so the timed notes are on your screen and the audience sees only the slides.
- Keep the PDF on a USB stick as a fallback (the video slides show a still).
- Watch the time cue at the top of each note. If you are more than 2 minutes late at the start of a chapter, shorten the next video slide to its first two steps.
- Backup slides start after slide 30. Jump to one by typing its number in slideshow mode (for example 33 Enter for B2) or with the slide sorter.
- Optional: have the app open with the demo login for a live answer during the questions.

The script

1. Title

0:00 - 0:45

Key message: one app that runs a whole Castrol distributor, and shows the brand what happens at every outlet.

Good morning, and thank you for having us. I am from KAD Motors, the Castrol distributor in Armenia.

In the next 35 minutes I want to show you KAD OS, the app our own team built to run the distributor: every visit, every order, every payment and every delivery.

But today I will show it through your eyes, as sales and marketing people: what it tells the brand about the market, outlet by outlet.

Everything you will see is the real app, with demo data. After 35 minutes we keep ten minutes for your questions.

2. Agenda

0:45 - 1:45

Key message: five short chapters, each one a problem and the answer.

Here is the plan. First, the opening: what the brand cannot see today, and what KAD OS is.

Then five chapters. One: every visit is real, how we know a rep was really at the outlet. Two: the brand sees every outlet, what is on the shelf and where Castrol can grow. Three: orders and money under control. Four: how AI keeps the team on plan. And five: how we got the whole team to use it, and what comes next.

Each chapter starts with one question. Keep your questions in mind; we take them all at the end.

3. The brand's blind spot

1:45 - 4:15

Key message: these six blind spots are the reason the app exists.

Let me start with a situation you all know. A marketing team plans a campaign for a new product line. They ask the distributor: in which shops is our product on the shelf today, and where is it missing? The honest answer usually is: we think so, we will check, give us two weeks.

That is the blind spot. So here are six questions that every Castrol sales or marketing team asks about the market, and that are hard to answer today.

One: was the outlet really visited? A visit report says yes, but nobody can prove it. In KAD OS a visit is a GPS check-in with a photo, and the app refuses it if the rep is more than 300 metres away.

Two: what is on the shelf? We usually learn it from a store audit once in a while. In KAD OS the rep checks the Castrol shelf at every visit.

Three: where is fake product sold? This hurts the brand most, and it is the hardest to find. In KAD OS fake product is flagged outlet by outlet.

Four: which competitors are in the shop? The rep ticks the competitor brands he sees, at every visit.

Five: which shops do not buy Castrol yet? We keep them in the app as potential customers, with the reason, a potential level and the litres we expect.

And six: do our offers reach the shop? That is the next step, the customer app, which I will show at the end.

Keep these six questions in mind. Every chapter answers one or more of them.

4. What is KAD OS

4:15 - 5:30

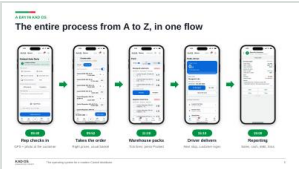

Key message: everyone in the distributor works in the same app, so the data is complete.

So what is KAD OS? It is one app for everyone in the distributor.

The sales reps visit the outlets, check in, take orders and collect payments. The sales director plans the routes and approves prices and credit. The warehouse packs the confirmed orders and counts the stock. The driver delivers on an optimised route, and the customer signs on the driver's phone. The accountant handles invoices, payments and cash. And management sees live dashboards and gets a report every evening.

Why does this matter for you? Because when everyone works in one system, the data about each outlet is complete: the visit, the shelf, the order, the payment and the delivery are all connected.

It opens from a link on any phone, with no app store, and it works without signal. So there is nothing to install and nothing to buy for the field team: they use the phones they already have.

5. A day from A to Z

5:30 - 7:00

Key message: one order, from the shelf to the evening report, without paper or calls.

Here is one day, from A to Z, with demo data.

At 09:40 the rep checks in at a shop, with GPS and a photo, and records the shelf.

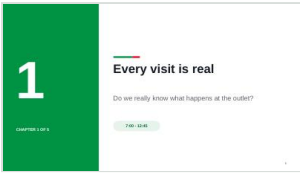

At 09:52 he takes the order, from the customer's usual basket, at the right price list.

Before noon the warehouse picks it, ticking each line, and presses Packed.

In the afternoon the driver follows the optimised route, and the customer signs on the phone.

And at 19:00 management gets the evening report: sales, cash, debt and risks.

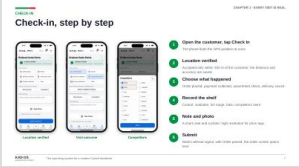

No paper, no phone calls, nobody types anything twice. Now let us go chapter by chapter, starting with the visit.

6. Chapter 1

7:00 - 7:15

Chapter one. The question: do we really know what happens at the outlet? Let me show you how a visit works.

7. Check-in, step by step

7:15 - 9:15

Key message: a visit only counts when the rep is really there, and every visit brings back shelf data.

This is the check-in, step by step.

The rep opens the customer and taps Check In. The phone finds the GPS position at once.

The check-in is accepted only within 300 metres of the outlet, and the real distance and the GPS accuracy are saved with it. So a visit report from the office or from the car is not possible.

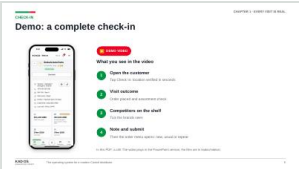

Then he chooses what happened: order placed, payment collected, assortment check, delivery or a revisit.

Then comes the part that matters most for you: the shelf. He records whether Castrol is available, whether the full range is there, and whether there is fake product. And he ticks the competitor brands he sees on the shelf.

He adds a short note and a photo, in high resolution when he wants to capture the price tags, and submits.

It works without signal, which matters in basements and in the regions. If an order was placed, the order screen opens straight away.

For a team lead, the important point is this: you no longer manage the team by asking where they were. You can see it, and you can spend your time on what they found.

8. Demo video: check-in

9:15 - 10:45

Key message: the whole visit takes under a minute, so reps really do it at every outlet.

Let me play the video. (Click the phone.)

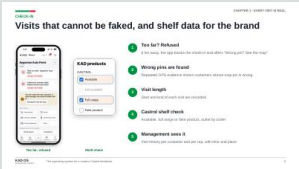

The rep opens the customer and taps Check In; the location is verified in a few seconds.

He selects the outcome: an order, and an assortment check.

Here he ticks the competitor brands on the shelf.

He writes a short note and submits. Because an order was placed, the order menu opens: a new order, the usual basket, or a repeat of a past order.

The whole visit record takes less than a minute. That is the reason reps really do it at every outlet, and the reason the shelf data is complete and not a sample.

9. Visits that cannot be faked

10:45 - 12:45

Key message: the brand gets proven visits and outlet-level shelf data it never had.

Two more details that make the data trustworthy.

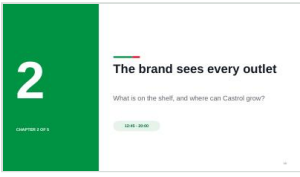

On the left, the rep is 6 kilometres from the customer. The app blocks the check-in. If the pin on the map is wrong, it offers to check the map; and repeated GPS evidence from real visits shows management which customers have a wrong pin, so it gets fixed.

The start and the end of each visit are recorded, so we also know how long the rep stayed.

On the right is the Castrol shelf check. Outlet by outlet: is Castrol available, is the full range there, is there fake product.

This is something the brand never had: not an audit of 50 shops once a year, but every outlet, at every visit, with the date, the place and the rep.

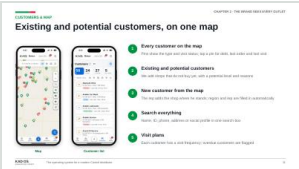

Management sees all of it in the visit history, per customer and per rep. That ends chapter one: every visit is real.

10. Chapter 2

12:45 - 13:00

Chapter two, and the most important one for this room: what is on the shelf, and where can Castrol grow?

11. Customers & map

13:00 - 14:30

Key message: every outlet is on the map, including the ones that do not buy Castrol yet.

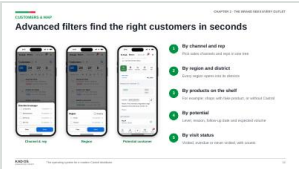

Every customer is on the map and in one list.

Not only the shops that already buy from us, but also the potential customers, the shops we want to win. A pin shows the type of customer and the visit status, and one tap shows the debt, the last order and the last visit.

When a rep finds a new shop in the field, he adds it straight from the map, where he stands; the region and the responsible rep are filled in automatically.

One search box finds any customer by name, ID, phone, address or social profile.

And every customer has a visit frequency. A customer who was not visited on time is flagged, so no outlet is forgotten.

12. Advanced filters

14:30 - 16:00

Key message: the filters turn the field data into target lists in seconds.

The filters are where the data becomes useful.

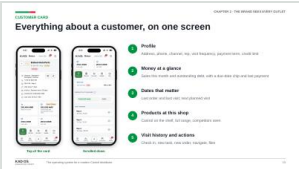

You can filter by sales channel and rep in one tree, and by region and district.

You can filter by the products found on the shelf, for example all shops with fake product, or all shops without Castrol.

You can filter the potential customers by their level and by the reason they do not buy yet.

And you can filter by visit status: visited, overdue or never visited.

For a potential customer we record the potential level, the reasons, for example a price mismatch or a contract with a competitor, the litres per month we expect, and the next follow-up date. So the team knows exactly whom to win next, and why. For example: all workshops in one district that do not buy Castrol because of a contract with a competitor, each with its next follow-up date.

13. Customer card

16:00 - 17:30

Key message: one screen tells the whole story of one outlet.

The customer card puts everything about one outlet on one screen.

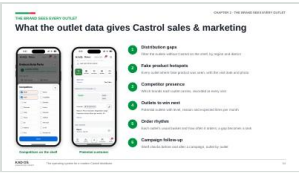

At the top, the profile: address, phone, channel, rep, how often to visit, the payment term and the credit limit.

Then the money at a glance: sales this month, and the outstanding debt with a chip that shows when it is due, and the last payment.

The dates that matter: last order, last visit, next planned visit.

And lower down, the products at this shop from the latest shelf check: Castrol on the shelf, the full range, and the competitors seen. Then the visit history, and one-tap actions: check in, new task, new order, navigate.

Before a rep walks in, he knows the whole story of this outlet in ten seconds.

14. What the outlet data gives Castrol

17:30 - 20:00

Key message: the same field data answers the questions sales and marketing teams ask every month.

So what does all this give Castrol's sales and marketing teams? Six things.

One, distribution gaps: filter the outlets without Castrol on the shelf, by region and district. That is your list for distribution drives.

Two, fake product hotspots: every outlet where fake product was seen, with the visit date and the photo. That is evidence for action, not a rumour.

Three, competitor presence: which brands each outlet carries, recorded at every visit, not once a year.

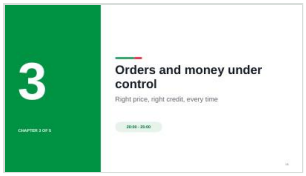

Four, the outlets to win next: potential customers with their level, the reason they do not buy, and the litres we expect each month. You can see where a price or a contract is the barrier.

Five, order rhythm: each outlet's usual basket and how often it orders. When an outlet stops ordering, the gap becomes a task for the rep, as you will see in chapter four.

And six, campaign follow-up: because the shelf is checked at every visit, you can compare the shelf before and after a campaign, outlet by outlet.

Go back to the campaign from the beginning. With KAD OS the marketing team does not wait two weeks. The sales director opens the filters: region, shops without the product on the shelf, and the potential outlets nearby. In a minute there is a target list, and each rep sees his part of it on his route. A month later, the shelf checks show which outlets now carry the product. That is the difference between hoping and knowing.

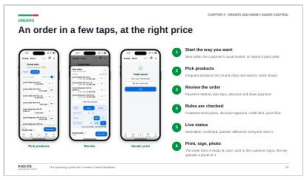

That ends chapter two: the brand sees every outlet.

15. Chapter 3

20:00 - 20:15

Chapter three: orders and money. Right price, right credit, every time.

16. Orders

20:15 - 21:45

Key message: orders follow the price list and the credit rules automatically.

An order takes a few taps.

The rep starts a new order, the customer's usual basket, or a repeat of a past order. The products this customer buys often come first, with brand chips, search, and the stock shown.

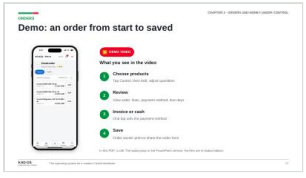

In the review he sets the payment method, the due days, the discount and the down payment.

And KAD OS checks the rules at once: the price for this customer's level, a discount up to 3 percent automatically and anything more only with approval, the credit limit, and a price floor that only the CEO can override.

After saving, everyone sees the status live: submitted, confirmed, packed, delivered.

The order form is ready at once: the rep prints it, the customer signs, and the rep uploads a photo of the signed copy, so the document is always attached to the order.

For the brand this means one thing: the agreed price list is really applied in the field.

17. Demo video: order

21:45 - 22:45

Key message: from the shelf to a saved order in about a minute.

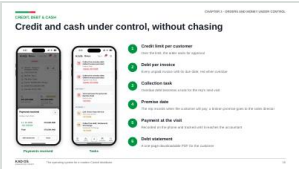

Here is a real order in the video. (Click the phone.)

The rep taps Castrol and adds the products, adjusting the quantities.

He opens the order: the lines, the payment method and the due days.

One tap sets invoice or cash.

He saves, and the order form is ready to print or share.

18. Credit, debt & cash

22:45 - 24:00

Key message: debt is followed invoice by invoice, so nobody has to chase it by memory.

Credit and cash. Every customer can have a credit limit; an order above the limit waits for approval.

Debt is tracked invoice by invoice, with its due date, and turns red when it is overdue.

An overdue invoice automatically becomes a collection task for the rep's next visit.

The rep records the date the customer promises to pay; if the promise is broken, the sales director is told.

Payments are recorded on the phone during the visit and followed until the cash reaches the accountant.

And the customer can get a one-page debt statement as a PDF.

A distributor with healthy credit is a distributor that can keep buying Castrol.

19. Human approvals

24:00 - 25:00

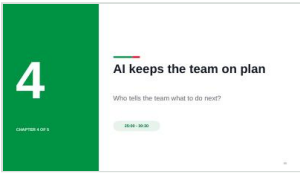

Key message: the system does the work, but people decide the things that matter.

One principle runs through the whole app: automation does the work, people approve.

Discounts above 3 percent need management approval. A price below our cost needs the CEO. An order over the credit limit waits for the sales director or the accountant. New orders are confirmed by the sales director. Every invoice is approved and signed by the chief accountant. Cash is confirmed by the accountant when it arrives. Changes reps make to customer data are reviewed by management.

And the AI agent itself started in test mode: management read what it would say and tuned it before switching it on.

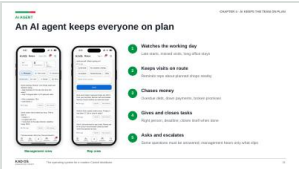

That ends chapter three.

20. Chapter 4

25:00 - 25:15

Chapter four. Who tells the team what to do next? In KAD OS, an AI agent.

21. AI agent

25:15 - 27:00

Key message: the AI agent is a team lead that never forgets.

This is our AI agent. In the app we call him Vaghinak.

He watches the working day: late starts, missed visits, long stays in the office.

He keeps visits on route: he reminds reps about planned shops nearby.

He chases money: overdue debt, down payments and broken promises.

He gives each task to the right person with a deadline, and the task closes by itself when the problem is solved, for example when the payment arrives.

Some of his questions must be answered before the rep carries on, and management only hears about what slips.

On the left is the management view, on the right the rep's view. He talks to each person in their own tone: formal with management, friendly with the reps.

Look at the management view: an evening message like "Rep B started 41 minutes late, the third time this week; Rep C stopped after 4 of 9 planned visits". And on the rep's side: "Nice work today. There are two planned shops 200 metres from your last stop. Will you drop in before you leave the area?"

For a team lead in this room, think of him as an assistant who follows up on every outlet, every day, and who never forgets.

22. How the AI agent decides

27:00 - 28:45

Key message: watch, notice, assign, check, escalate.

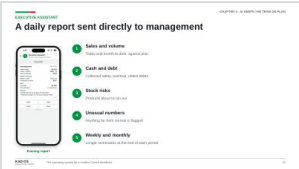

How does he decide? Five steps. He watches the data the app collects all day: orders, payments, visits and check-ins. He notices when something differs from the usual pattern of a customer or a rep. He assigns a task to the right person, with a deadline. He checks the data to see whether it was done, and closes the task by himself. And he escalates to management only when it keeps slipping.

Three examples. A customer usually orders every two weeks, and this time no order came. The agent gives the rep a task to visit and remind the customer, and the task closes when the next order arrives. For the brand, that is a lost order saved.

A customer pays every week, and this week there is no payment. The agent creates a task to collect it, and when the rep records the money on the customer card, the task closes by itself.

And the team starts the day at the office. When someone arrives late, the agent asks for the reason, and after the third time management is told.

The pattern is always the same: the agent notices early, gives a clear task to one person, and checks the result in the data. Nobody has to remember to follow up.

23. Executive Assistant

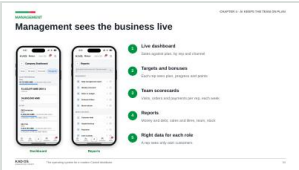

28:45 - 29:30

Key message: management gets the day's numbers without asking for a report.

For management there is the Executive Assistant. Every evening it sends a short report: sales and volume today and month to date against plan, cash collected and overdue debt, the products about to run out, and any number that is far from normal.

At the end of each week and each month it sends a longer summary.

Nobody prepares this report. It is written from the same data the team enters during the day.

24. Management dashboards

29:30 - 30:30

Key message: live numbers, and each person sees what their role needs.

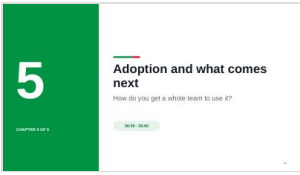

And when management wants to look deeper, the dashboard is live: sales against plan, by rep and by channel.

Every rep sees his own targets, progress and bonus points. Team leads get a weekly scorecard per rep: visits, orders and payments.

The reports cover money and debt, sales and litres by product line, the team and the stock.

And each person sees only what their role needs: a rep sees only his own customers.

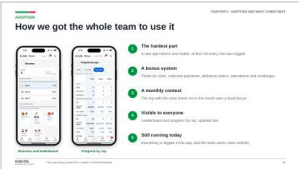

That ends chapter four.

25. Chapter 5

30:30 - 30:45

Last chapter, and the question every team lead asks: how do you get a whole team to use it?

26. Adoption

30:45 - 32:30

Key message: adoption is a people project: make the app worth using, and reward it.

Honestly, this was the hardest part. A new app means new habits, and at the start not every visit was logged.

We solved it in two ways. First, a bonus system: reps earn points for their work in the app, for visits, collected payments, delivered orders, attendance and small challenges.

Second, a monthly contest: the rep with the most check-ins in the month wins a fixed bonus. The leaderboard and the progress of each rep are visible to everyone and update live.

We still run the contest today. It pushes the team to log all their work in the app, and the company wins too, because the reps simply work more actively.

And the app itself helps: the reps designed it with us, so it saves them time, it does not cost them time. That is the real secret of adoption.

If I give the team leads in this room three lessons from our experience, they are these. First, start with what saves the rep time, for example the usual basket and the debt on the customer card, not with control. Second, make the results visible to everyone, every day. And third, reward the habit you want, in our case check-ins, for a few months, until it becomes normal.

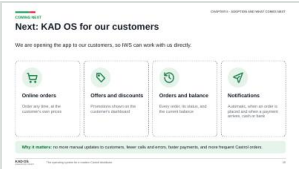

27. Built and adopted

32:30 - 33:15

Key message: three months to the first live version, the whole team in the fourth.

How long did it take? We started in May 2026. The first version was live three months later, in August. In September, the fourth month, the whole field team was working in the app. And by the sixth month we reached the complete system you saw today, with improvements delivered every week, based on what the team asked for.

28. Next: the customer app

33:15 - 34:30

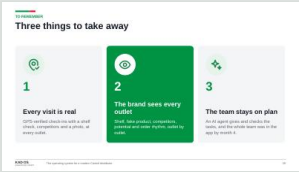

Key message: next, the outlets themselves join KAD OS, and Castrol's offers reach the shop directly.

What comes next answers the sixth question from the beginning: do our offers reach the shop?

We are opening KAD OS to our customers, so the workshops can work with us directly. They will order online at any time, at their own prices. They will see offers and discounts on their own dashboard. They will follow every order and see their balance. And they will get a notification automatically when an order is placed and when a payment arrives.

Today we still send customers updates about their orders and payments by hand. With the customer app this step disappears, because they see everything on their own dashboard.

For the distributor this means fewer calls and errors and faster payments. For Castrol it means a direct channel for promotions to every outlet, and customers who order more often. Imagine launching an offer and seeing, in the same week, which workshops opened it and ordered.

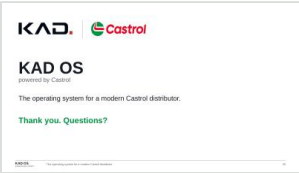

29. Three things to remember

34:30 - 35:00

Key message: repeat the three takeaways slowly.

If you remember three things from today: one, every visit is real, verified by GPS, with a shelf check. Two, the brand sees every outlet: shelf, fake product, competitors, potential and order rhythm. And three, the team stays on plan, with an AI agent, and the whole team adopted it within four months.

30. Thank you, questions

35:00 - 45:00

QUESTIONS (10 minutes).

Thank you. We are happy to take your questions, and we can show any part of the app live.

Tips for the presenter: repeat each question before answering; keep each answer under a minute; open a backup slide only when it helps (home screen B1, warehouse B8, delivery B10, accounting B7, routes and fuel B6, security and offline B12). Stop at 45:00 and offer to continue one to one.

Likely questions and suggested answers

Can a rep fake a visit?

No. A check-in is accepted only within 300 metres of the outlet; the real distance and the GPS accuracy are saved; the start and end of the visit are recorded; and repeated GPS evidence shows customers whose map pin is wrong. (Slide 9.)

How reliable is the shelf data?

It is recorded by the rep at every visit, with a photo, and management sees it in the visit history per outlet and per rep. Because it is collected at every visit and not once a year, a wrong entry stands out quickly.

What happens without internet?

The app keeps working. Visits, orders and stock counts wait on the phone and are sent when the signal comes back. (Backup B12.)

How did you get the reps to use it?

A bonus system with points for the work done in the app, and a monthly contest: the rep with the most check-ins wins a fixed bonus. And the reps helped design it, so it saves them time. (Slide 26.)

What if the AI makes a mistake?

People approve every decision that matters: discounts, prices below cost, credit, invoices and cash. The AI agent started in test mode and was switched on only after management tuned it. (Slide 19.)

Does it connect to accounting or ERP systems?

Yes. It has an integration API, and it is connected to our local invoicing system, so invoices are created without typing them again. (Backup B2 and B7.)

Where is the data, and who can see it?

In our own cloud system, over an encrypted connection, with protected logins and an audit trail. Each person sees only what their role allows; the AI analyst sees customers and staff only as codes. (Backup B12, B11.)

Which languages does it support?

Armenian and English today.

How long did it take?

Three months to the first live version (May to August 2026), the whole field team in the app in the fourth month, and the complete system by the sixth month. (Slide 27.)

Can other distributors use KAD OS? [owner to confirm the answer]

Suggested: it was built for our own business, and we are open to discussing it with Castrol. Please do not promise dates or prices on stage.

Can Castrol receive the outlet data (shelf, fake product, competitors)? [owner to confirm the answer]

Suggested: today the data serves our own team; how to share outlet-level data with Castrol is something we would like to agree together.

What did it cost? [owner to confirm the answer]

Suggested: it was built by our own team; we prefer to discuss the details separately.

Backup slides (only when a question needs them)

B1. Home screen

The home screen as management sees it: 1, notifications and the menu; 2, this week's progress, visited, remaining and overdue customers; 3, quick actions, each tile opens a module; 4, the bottom bar with Home, Activity, the map in the centre, Customers and Orders. Each role sees its own home: a rep starts with today's tasks, the warehouse with what to pack, the driver with the next stop.

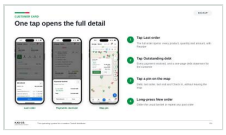

B2. How it works

Four steps: the team works in the app; KAD OS checks the rules (prices, discounts, credit, stock); AI spots problems and gives a task to the right person; management sees it live. Underneath is one cloud system with one secure database; the accounting system is connected through an integration API, so nobody types anything twice.

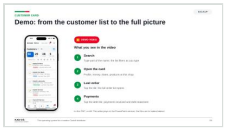

B3. The distributor's problems

Visits hard to monitor become GPS check-ins with a photo; orders by phone become orders in the app at fixed price lists; overdue debt found late becomes debt per invoice with automatic collection tasks; no view of the shelf becomes a shelf check at every visit; reports that take days become live dashboards and evening reports; problems noticed too late are picked up by the AI agent.

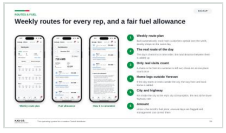

B4. Customer card detail

Every tile opens its detail: the last order with every line and a Reorder button; the payments received behind the debt tile, and a one-page debt statement; a map pin shows debt, last order and last visit with a Check In button; a long press on New order offers the usual basket or a repeat of any past order.

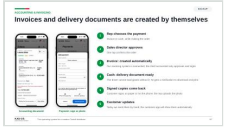

B5. Demo video: customer card

Search for a customer, open the card, open the last order with all its lines, and the payments received behind the debt tile.

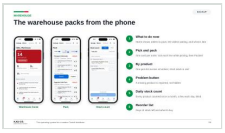

B6. Routes & fuel allowance

Each rep has a weekly route plan, built automatically: the rep's customers spread over the week, nearby shops on the same day. The fuel allowance is calculated from the real day: the check-ins in time order and the road distance between them; a check-in far from its customer is left out; home legs are added outside Yerevan; city and highway kilometres use different consumption; unusual days are flagged and management can correct them.

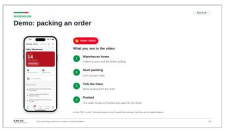

B7. Accounting & invoicing

The rep chooses invoice or cash while making the order; the sales director approves; for an invoice, the invoice is created through the connected local invoicing system and the chief accountant approves and signs; for cash, the delivery document is created and the driver is notified to download and print it. Signed copies come back as photos. Customer updates are still sent by hand today; the customer app will show them automatically.

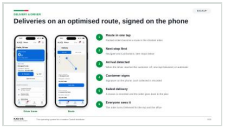

B8. Warehouse

The warehouse home shows orders to pack, the oldest waiting and what is late. One card per order: tick each line while picking, then Packed. A pick list by product across all orders, with short stock in red, and a Problem button. A daily blind stock count, each product once a month, and a reorder list with days of stock left.

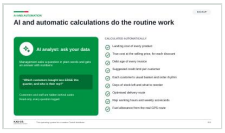

B9. Demo video: packing

From the warehouse home to the pack screen, ticking the lines while picking, and Packed; the order then waits for the driver.

B10. Delivery & driver

Packed orders become a route in one tap, in the shortest order. The driver sees the next stop first, with Navigate and Call. Arrival is detected; management chooses whether that does nothing, offers a one-tap Delivered, or marks it delivered automatically. The customer signs on the phone, cash collected is recorded, a failed delivery keeps its reason, and the order turns Delivered for everyone.

B11. AI analyst & calculations

Management can ask the AI analyst a question in plain words and get an answer with numbers; customers and staff are hidden behind codes, it is read-only and every question is logged. Calculated automatically: landing cost, true cost at each discount, debt age, suggested credit limit, usual basket and order rhythm, days of stock and reorder list, delivery route, working hours and scorecards, fuel allowance.

B12. Built for field work

Any phone or PC from a link, no app store; works offline and sends later; fast on cheap phones (tested on a slow phone); role-based access; encrypted connection, protected logins and an audit trail; our data stays in our own cloud system.
